DRAGONS

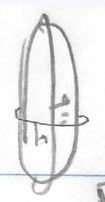
Phoenixes live in Mt Vohlcan, (mostly).



Phoenix

Phoenixs have a wingsp-
-an of about 15-16 ft. They are a cousin of the Frohstfahlcoohn (Frocst-falcoon). Phoenixes live in Mt Vohlcan, (mostly). Eats mostly Sahlahvah (Sal-uh-vuh) and sometimes picks a fight with a Rohmaanstrom (Roe-min-strom). Can tolerate up to 500,000°F. There eggs weigh about 5 pounds and a 5" around the top and 3" around the side. Eggs are dropped into lava pools and only hatch in lava. If an egg hatches out of lava it hatches into a Roebihn (Roe-bin), a cross between a Frohst and a Phoenix.

Not much is known about this strange bird, but we do know it does not have eggs.

Roebihn

Roebihns live at the border of Suhnlihned and eat mostly Throht (Trow-th) Not the best flier but is a great swimer. Roebihns always have to watch out for Water Lhions (Lins). Not much is known about this strange bird, but we do know it does not

Roebihn (con.)

have eggs. They only keep alive when Phoenix eggs are hatched in plain air.

Its ice breath is actually water.

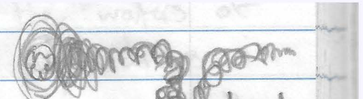
Frohstfahhlcoohn
(froest-fal-coon)

The Frohst fahhlcoohn's (shortened to the Frohst) best defense is its icy ~~beak~~. breath. Its ~~wing~~ wingspanl is about 8 ft long. The eggs weigh 10 ounces and are 5" around the top, and 3" around the side. Eggs must be chilled at -5,000,000°F in order to survive. Lives mostly in the ancient Aravah trees. It eats mostly Sunzard (Sun-zard). Lives up to 150 years and lays 5 egg in its whole lifetine. Its ice breath is actually water. It starts at 33°F and goes down to -9,999,999,999,999°F. Frohsts also eat ice. The Frohst can breath Ice by pushing a chunk of ice into its throuat. Then it melts the ice with special warm water glands. A Frohst has about 5 muscles in its throuat that pull and push. Then it pushes the water out. Right before the water comes out, Frohst insect a liquid that freezes the water →

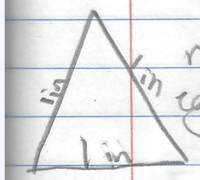
These creature range from 2 ft. to 3 1/4 of a Mile long.

the biggest tooth was 1 inch square.

Guhstvhwaler



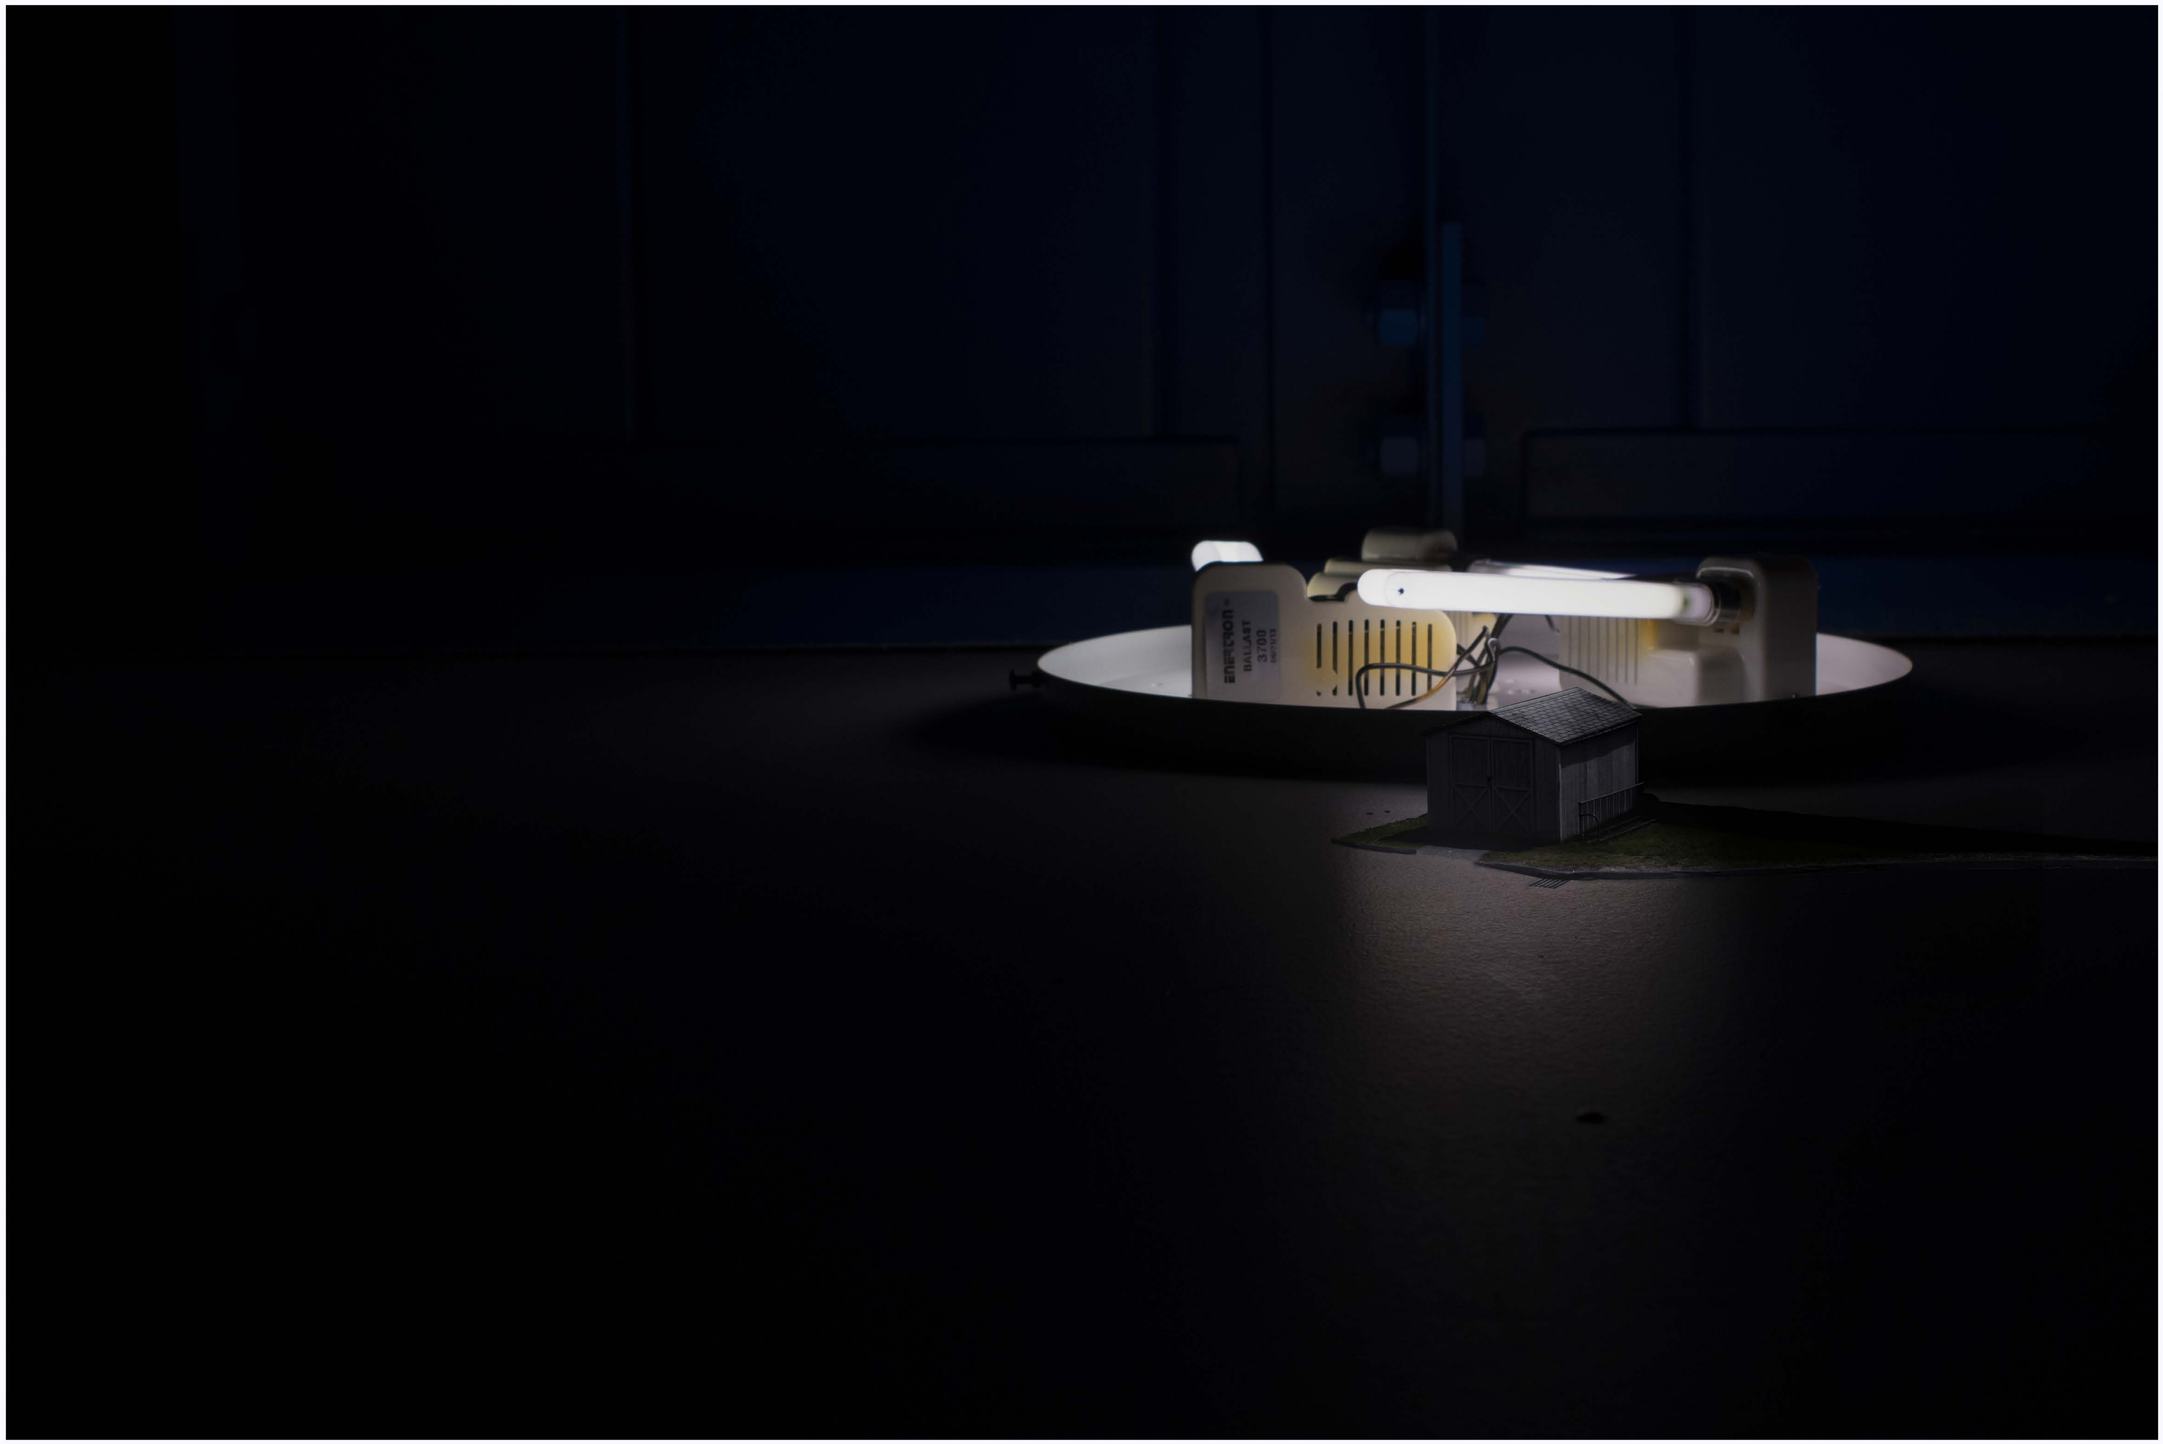
There are 2 species of Guhst-vhwalers (gust-veraler), Suhnlihned and Ilahndrindhn. Suhnlihned Guhstvhwalers live in only the Lava-Lake Pit. Ildmd nohm Guhstvhwalers live in the underground caverens of Frehzeclehr Lake. These creature range from 2ft. to 3½ of a Mile long. There eggs are 5mm around the top and 2mm around the side. Baby guhstvhwalers collect sand untill they are 2ft long (width doesn't matter) then they grow teeth. The biggest tooth was 1inch square. Guhstvhwalers are only killed by darkness (Suhnlihned) or, Light (Ilahndrindhn). They also live in Tonahlo (caves).



The secret to a dragon's flight is in the bones.

Dragon

A bigger cousin of the Flamebear (flame-bear). Usually has a wingspan of 40 feet, 70 ft. head to tail. It's teeth are 4 inches square. Its firey breath ranges 80° to 5,000° Farinhite. In order to breathe fire a dragon heats up its neck with gases in its stomach. Then it simply breathes. It uses its tounge to conduct the flame. The secret to a dragon's flight is in the bones.



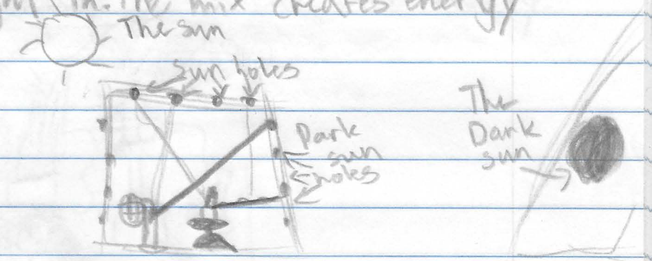
The mix creates energy

Roots

✓

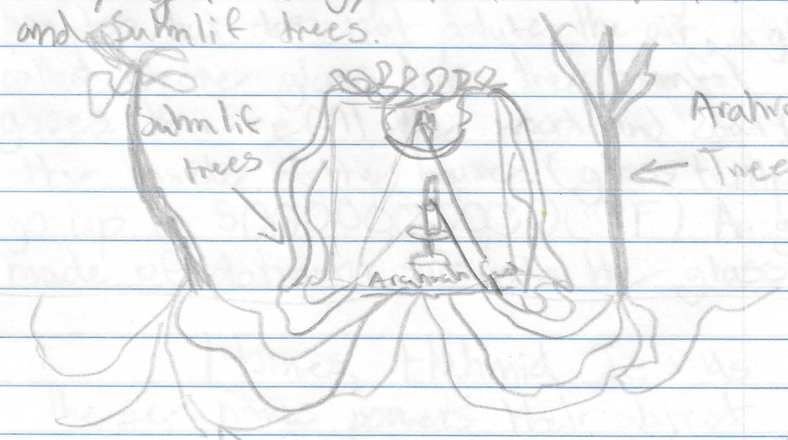
Homes, Tonahlo

Tonahlin homes actually use darkness to make light. They peirce holes in their roofs to let light in. The put holes on the sides to let dark light in. The mix creates energy



Homes, Arahvic

They get energy from Arahvah trees and Sunlit trees.

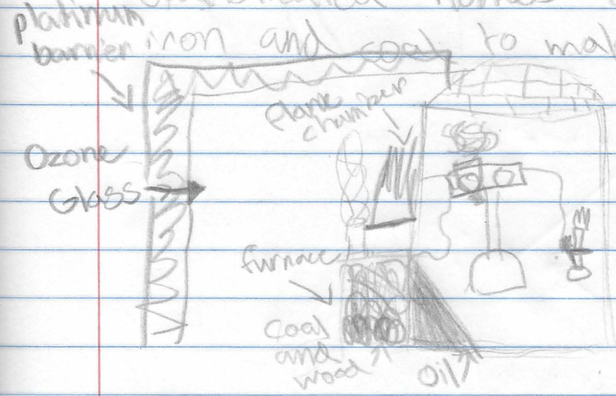


Arahvics use a soil called Arahvah food to attract the roots.

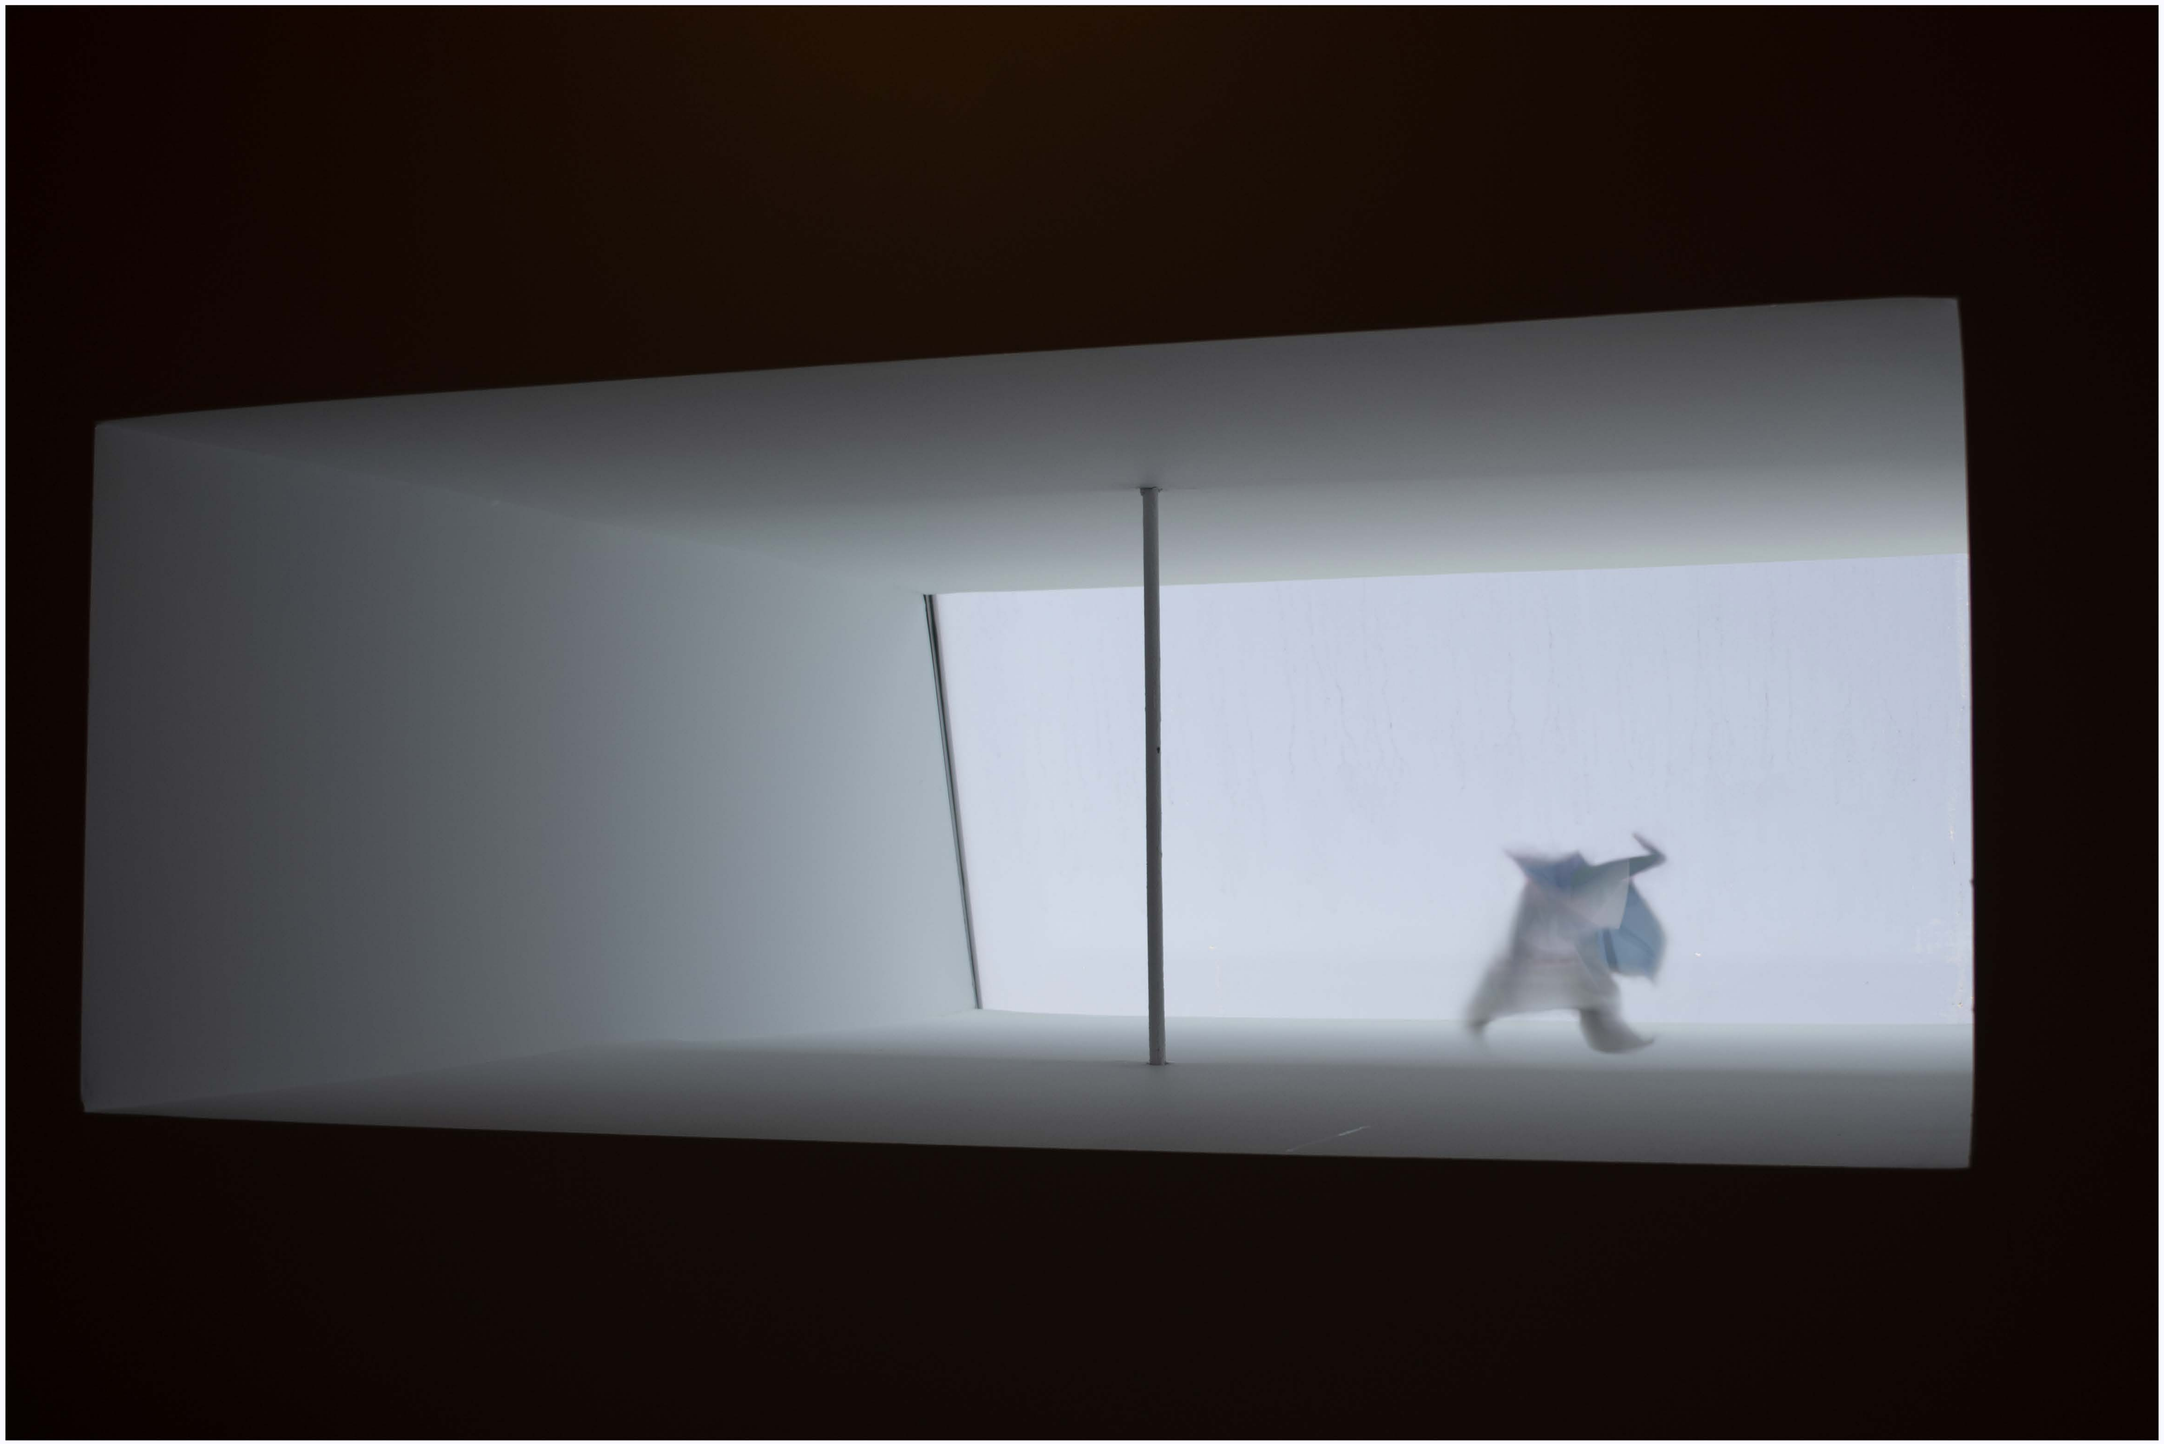
These Homes are the most stafisticated homes of all.

✓ Homes, Sviath (NO Real Homes in the Frozen Vallies.)

These Homes are the most stafisticated homes of all. They use iron and coal to make electricity.



Wires conect power to the object. Works nonstop but does not polute the air, a glass called Ozone glass traps the harmful gases. You refill the wood and coal from the inside of the house. (glass temperature go up to 500,000,000,000°F) A gate made of platinum surounds the glass.



They are part bird, part, bear, part wolf, part, coyote, part ankylosaurous.

SV

Pholoerbehr
(Pa-lore-ber)

Pholoerbehrs live mostly in the Freezing Vallies (Frozen). They are part bird, part bear, part wolf, part coyote, part ankylosaurous. It is 6ft head to tail. Wingspan is about 8 ft. Eats mostly Frohstfallcoohn (Froest - falcoon). It hibernates ~~from~~ all year except for Summer. Its tail is made of metal found only in Mt. Prihce Hn. Pholoerbehrs also eat Wahletohts too.

It has infinate breathing under water.

@ Silphaserpehnt
(silfa-serpent)

A type of serpant named after the legend of Silpha. It is very solitary, and mating season is actually 1 day long. Baby Serpents are usually 10 ft long. Adults are 50 to 70 feet long. Teeth usually 6 inches. Swims from 10 mph to 150 mph. It has infinate breathing under water. Eggs wreigh 250 pounds and are 5 feet around the top and 3 feet around the sides.
